

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class parser_help_exception["parser::HelpException"]
    std_exception <|-- parser_help_exception
    class parser_help_exception {
        + what()
    }
```

The diagram illustrates an inheritance relationship. At the top is the 'std::exception' class, represented by a white box with a black border, divided into three horizontal sections. The bottom section is empty. Below it is the 'parser::HelpException' class, represented by a gray box with a black border, also divided into three horizontal sections. The top section contains the class name, the middle section is empty, and the bottom section contains a public method '+ what()'. A blue arrow with a hollow triangular head points from the top of the 'parser::HelpException' box to the bottom of the 'std::exception' box, indicating that 'parser::HelpException' inherits from 'std::exception'.

parser::HelpException

+

what()
